

# Jira Ticket 1 - Tests Done and Test Results

Backend case intake, authentication, case retrieval, and protected evidence upload/retrieval

## Overview

|                |                                                                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ticket Scope   | Implemented backend foundation: JWT authentication, register/login/me, protected case creation, case listing, single-case retrieval, MySQL storage, and protected image evidence upload/download. |
| Backend Stack  | Node.js, Express.js, MySQL, JWT, bcrypt, multer, mysql2/promise, local image storage.                                                                                                             |
| Testing Method | Manual backend API testing using Windows PowerShell native requests and a PowerShell 5-compatible multipart upload script.                                                                        |
| Overall Result | PASS - Ticket 1 workflow completed successfully and was accepted for moving forward to Ticket 2.                                                                                                  |

## Tests Done and Test Results

| Test Area                 | Tests Done                                                                                                             | Expected Result                                                                                       | Actual Result                                                                                     | Status |
|---------------------------|------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|--------|
| Server startup and health | Started backend with npm.cmd run dev and called GET /api/health.                                                       | Backend starts on port 8080 and returns healthy response.                                             | Backend started successfully after MySQL configuration was corrected. Health endpoint responded.  | PASS   |
| Database setup            | Ran schema.sql against local MySQL database and verified backend could connect.                                        | users, cases, and evidence_files tables available; backend connects without crashing.                 | Database-backed routes worked after real .env values and MySQL transport setting were configured. | PASS   |
| Renter registration       | Submitted POST /api/auth/register with fullName, email, password, and role RENTER.                                     | User account created and password hashed; password hash not returned.                                 | Account registration succeeded; API returned safe user object.                                    | PASS   |
| Renter login and JWT      | Submitted POST /api/auth/login and saved token from response.                                                          | Valid JWT returned and usable on protected routes.                                                    | Login returned JWT; Authorization: Bearer token worked for protected endpoints.                   | PASS   |
| Logged-in user            | Called GET /api/me with renter JWT.                                                                                    | API returns authenticated user details.                                                               | Returned id, fullName, email, and role.                                                           | PASS   |
| Case creation             | Submitted POST /api/cases with renter, landlord, property, dispute, amount, date, and evidenceDescription fields.      | Case created with status INTAKE_SUBMITTED and caseld returned.                                        | Case was created and returned a caseld.                                                           | PASS   |
| List cases                | Called GET /api/cases as renter.                                                                                       | Renter sees their own cases only.                                                                     | Created case appeared in renter case list.                                                        | PASS   |
| Single case retrieval     | Called GET /api/cases/:caseld as renter.                                                                               | Full case object returned with generatedForm, landlordResponse, and arbitrationResult initially null. | Single case returned correctly with expected fields and placeholders.                             | PASS   |
| Validation errors         | Submitted invalid case data with missing fields, bad emails, invalid dispute type, and negative amount.                | API returns VALIDATION_ERROR with field-level messages.                                               | Validation error shape returned correctly.                                                        | PASS   |
| Unauthorized access       | Called protected case route without JWT.                                                                               | API returns UNAUTHORIZED.                                                                             | Unauthorized request was blocked.                                                                 | PASS   |
| Landlord matching access  | Registered and logged in a landlord whose email matched case.landlordEmail, then retrieved matching case list/details. | Matching landlord can view relevant cases.                                                            | Landlord access worked for matching case.                                                         | PASS   |
| Forbidden access          | Logged in unrelated landlord/user and tried to access another user case.                                               | API returns FORBIDDEN.                                                                                | Unrelated access was blocked.                                                                     | PASS   |

| Test Area              | Tests Done                                                                                  | Expected Result                                                         | Actual Result                                      | Status |
|------------------------|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|----------------------------------------------------|--------|
| Renter evidence upload | Uploaded image evidence through POST /api/cases/:caseId/evidence using multipart/form-data. | Image stored locally; metadata stored in MySQL; protected URL returned. | Evidence image uploaded and metadata returned.     | PASS   |
| Evidence retrieval     | Called GET /api/cases/:caseId/evidence and GET /api/evidence/:evidenceId/file.              | Metadata returned and image downloaded through protected route.         | Uploaded image downloaded and opened successfully. | PASS   |

## Validation Artifacts / Outputs Checked

|                        |                                                                  |
|------------------------|------------------------------------------------------------------|
| Primary Runtime Output | Working backend API on http://localhost:8080/api                 |
| Evidence Output        | Protected image evidence route returned downloadable image file. |
| Status at Completion   | Ticket 1 marked complete after local manual testing passed.      |

## Result Summary

Ticket 1 passed the manual test path. Authentication, case storage/retrieval, access control, validation handling, and protected evidence upload/retrieval all worked as expected.
